Special acknowledgement is made to the Federal Ministry of Consumer Protection,
Food and Agriculture Germany (BMVEL) for help in funding this publication.

WDCS is working with tour operators, researchers, fishermen, local communities and governments to protect whales and dolphins by encouraging careful whale watching that is a real learning experience, contributing both to local research and education programmes. We believe that whales and dolphins provide the key to enable people to understand and appreciate the sea and thus to care more about its future.

WDCS, the Whale and Dolphin Conservation Society, is the global voice for the protection of whales, dolphins, porpoises and their environment. The charity was established in 1987 and now has supporters all over the world and offices in Argentina, Australia, Germany, the UK and the USA. For more information on how you can help protect whales and dolphins around the world and to find out more about WDCS's work, please go to www.wdcs-de.org (German) or www.wdcs.org (English).

Erich Hoyt has been an authority on whale watching - writing, speaking and conducting workshops - since writing the first book on the subject, *The Whale Watcher's Handbook*, which was called a 'naturalists' classic' in BBC Wildlife Magazine. He has written more than 300 scientific articles, papers and reports; his other books include *Orca: The Whale Called Killer*, *Creatures of the Deep*, and *The Earth Dwellers*. Currently WDCS Senior Research Associate and Co-Director of the Far East Russia Orca Project, he lives near Edinburgh, Scotland.

Foreword

For as long as I can remember, I have been attracted to and fascinated by whales. I don't really know whether it is their amazing size, gentle charisma, intelligence or the close bonds to people that make us come under their spell.

Sadly, these peaceful mammals have been hunted with industrial methods over the past century and have become almost extinct. Just in time, the International Whaling Commission (IWC) voted an emergency whaling ban in 1982 which came into force in 1986. This moratorium has helped some whale stocks to avoid extinction and even start to recover. However, we are still a long way from a recovery of all whale stocks.

Nevertheless, some IWC member states believe that commercial whaling should resume. For more than a decade now, they have tried to lift the moratorium. Never mind that such a decision comes much too early, I am convinced that the resumption of whaling is unnecessary and superfluous for another reason.

Those that support the resumption of whaling often argue that the sustainable use of living resources is not just allowed, but recommended, citing the Rio declaration. I follow this argument but question it in relation to whales: Does such sustainable use have to be lethal? Aren't there non-lethal alternatives to using resources - alternatives which are truly sustainable and also linked to economic benefits which could even be higher than the consumptive or other use?

Fortunately, there is such an alternative. It's whale watching, a robust, expanding part of the tourism industry. Whale watching offers the possibility of observing these magnificent mammals in nature and to meet them at close range. For years, the government has been trying, in association with other like-minded countries, to bring whale watching under the competence of the IWC as an important additional use of whales. Sadly, the countries that support whaling have refused to accept the IWC's competence over whale watching. This, however, will not discourage the government from continuing to encourage the full recognition of whale watching within the IWC.

Anyone who joins a whale watching trip will never forget it. The excitement of experiencing the unity of people and nature, the encounter between such different creatures, is simply amazing. I encourage everyone to take the opportunity for such an adventure. I am very pleased and thankful to WDCS for adopting the whale watching issue with such passion, to collaborate with Erich Hoyt, such a reputable scientist, and to produce this publication highlighting the best whale watching opportunities in Europe. In the pages that follow, you can discover the most important whale watching sites around Europe. I hope and trust this guide will be in great demand and receive a wide distribution.

Renate Künast

Federal Minister of Consumer Protection, Food and Agriculture Germany

Whale, Dolphin & Porpoise Watching is taking off all over Europe

People don't usually think of whales and dolphins when they travel around Europe, but European waters offer a wide variety of reliable whale watch opportunities in spectacular locations.

Blues, orcas and friendly minkes in the midnight sun

'Whoosh!' The sound of a whale exhaling in the low midnight sun of north-east Iceland.

The response from people on our ship was instant but extremely varied as some four or five nationalities celebrated the arrival of leviathan with the gasp of 'O!', 'Wow!', 'Merveilleux!', '¡Incréible!', or 'Wunderbar!' Some sounds even drifted toward the profane, or were so spontaneous and guttural that they seemed a coded language of their own: the exclamation of the 'first time whale watcher'.

We were a boat full of 25 people including half a dozen children, not one of us ready for bed. We were cruising across calm Skjálfandi Bay in search of shared adventure, a chance to connect with nature. The icy peaks framing the western side of the fjord reminded us that we were near the Arctic Circle, but the reappearance of the whale, seconds later, brought us back to the moment.

The boat's naturalist or guide told us that this was one of the 'friendly' local minke whales. The skipper was careful to observe a respectful 100 m minimum distance so as not to crowd the whale. But, as often happens, the whale hadn't read the regulations. Seconds later, we had a minke whale raising its head clear of the water beside our boat. More gasps and sighs and an awful lot of cameras quietly snapping, as we treasured the moment. We were all suddenly big fans of wild minke whales, never mind the smell of second-hand herring on its breath.

Fin whale surfaces - and its 20m-long body comes into view.

On Wednesday, it had been blue whales off north-west Iceland - the largest animals ever, seven of them all around the boat. On Thursday, yesterday, we'd seen humpback whales, orcas and thousands of seabirds. It was not yet the weekend and, earlier today, we'd added two species of dolphins and a sei whale. Now here was a friendly minke whale.

This was the new Iceland. Better known two decades ago as a whaling centre, Iceland has become the whale watch capital of northern Europe where last year some 62,050 people went whale watching, approximately 30% of all visitors to the country.

You can watch whales from half a dozen different ports all around Iceland. The visitors who come to the north-eastern outpost of Húsavík find a warm, friendly whale watching community with a state-of-the-art whale centre, book store, inviting restaurants by the sea and choice of whale watch boats and skippers offering 2 or 3 trips a day. Those who arrive around the longest day of the year can go whale watching in the midnight sun and join the annual whale watch festival put on by the Húsavík Whale Centre - one of the highlights of the new whale watch calendar in Iceland.

How it all began

Whale watching in Iceland really only started in 1995. The first whale watch trips in Europe were boat tours in 1980 to see dolphins resident around Gibraltar. For most of a decade, that was all that was on offer. In the late 1980s, boat-based whale watching directed toward large whales started up in three countries. From Italy, enthusiasts began travelling to a prime fin whale area in the Mediterranean with numerous dolphins; Norway offered sure sightings of sperm and minke whales, as well as orcas, just offshore; and the Azores, about 1500 km west of Portugal, invited whale watchers to meet different groups of sperm whales and a wide variety of other whales and dolphins. Since then, whale and dolphin watching has grown steadily, spreading to most of Europe.

Today, whales and dolphins are proving to have considerable value to people in coastal communities across Europe - in terms of income from whale

watch tours, public education, research, and as symbols of a healthy marine environment which makes communities proud of themselves and attractive to visitors. Yet the hunting of cetaceans persists in some parts of northern Europe. We must not forget that minke, fin and other whales range throughout European waters and know no boundaries. The minke whales that Scotland, Ireland and Iceland watch are the same species and may be from the same populations as those which are hunted off Norway. The pilot whale species that are killed in the Faeroes, although not from the same population, are the basis of an industry in the Canary Islands worth tens of millions of Euros. The sperm and other whales now watched in the Azores bring thousands of visitors to the islands producing much more income and many more benefits than the whaling industry which persisted there until about two decades ago.

Breaching humpback whales are drawing people to whale watching around Europe.

Whale watching is still very young in Europe. Compared to other continents, Europe already has the lion's share of the world's tourism - so the overall market is strong. However, as successful as Europe has been with cultural tourism, nature tourism has been slower to catch on. Most tourists planning a trip to Paris, London, or Rome would find it difficult to believe that whales and dolphins live close to shore all over Europe. If marine nature tourism is to continue to expand successfully, the perception of Europe must be expanded. At the same time, those of us living in Europe must all become caretakers of the marine environment, watching what we do and what we dump in our seas. Marine operators must lead the way, keeping to a minimum any disturbance to the whales and dolphins and their habitat.

In this guide you will find an introduction to the operators who are pioneering whale watch tours

across Europe, as well as information on land-based cetacean watching and nature tours on which whales can be seen. We are spotlighting the best programmes - those which offer educational, research and conservation opportunities that will provide solid benefits for cetaceans. There are also practical details on when and where to go, how much the tours cost and what you can expect to find. Finally, we provide contact details for whale festivals, whale centres and national phone numbers and websites for reporting cetacean sightings.

Which whales, dolphins and porpoises can be seen?

Some 36 species of cetaceans can be seen in the waters of Europe, from Greenland east to the Russian Arctic and south to the Canary Islands and the Mediterranean Sea.

Sperm whales - the largest toothed whales on Earth - are the basis of whale watching off northern Norway and the Azores, and are also found in the Mediterranean. In northern Greenland, the tusked narwhals can be found, while Iceland is the most reliable area for blue whales. Belugas can be seen in the summer passing along the shore and coming into the river mouths of Greenland, as well as Svalbard and northern Russia. Humpback whales can be seen off south-west Greenland and around Iceland, though even the UK has had a few visits by humpbacks in recent years. Minke whales and harbour porpoises are found throughout the waters of northern Europe, especially during the summer. Fin whales can be seen in many areas but most reliably off southern Ireland and in the new Pelagos Mediterranean Sanctuary for Cetaceans off Italy, France and Monaco. The dramatic orcas can be seen around Norway and Iceland, as well as in the Strait of Gibraltar. Bottlenose dolphins live close to shore as part of resident populations around the UK, Ireland, France, Portugal, Croatia, Greece, Spain and the Canary Islands while farther offshore, Atlantic white-sided, white-beaked, common and other dolphins can be found in northern waters, and Fraser's, striped, and pantropical spotted dolphins are seen in warmer waters. Pilot whales are reliably found in the waters of the Canary Islands. Even beaked whale watching is becoming increasingly popular with the frequent sightings of these species off the Azores and the Canary Islands, as well as in the Bay of Biscay.

How does whale watching rate in Europe?

In general, European cetacean watch operations are of a high standard, with full attention to safety, and some consideration of education, research, and conservation values. There is still room for improvement on many tours but the cultural diversity of Europe adds considerable value to the experience of whale watching. Icelandic and Norwegian whale watching is sometimes conducted aboard classic Scandinavian sailing ships and fishing boats. In Ireland and Scotland, the European walking tour has been adapted to land-based whale watching along these rugged coasts. Azorean whale watches feature land-based viewing from the vigias, or watch towers, built by the whalers to search for whales.

In many communities across Europe, there is a growing recognition - as in North America, Australia, New Zealand, and a few other places - that the best way for whale watching to grow is to enhance its value through creating tours with trained naturalists, by inviting scientists aboard, and through making the visitor care about the conservation of whales and dolphins.

Checklist of cetaceans you can see in Europe

Some 36 species of cetaceans, 42% of the 86 cetacean species currently known around the world, can be seen in European waters. Here's a checklist to take with you next time you go whale watching, along with some notes about where they are found. With 2 or 3 trips to strategic locations such as Iceland, the Azores and southern Spain or the Bay of Biscay, and some good fortune, one might be able to see about half of these species in a matter of a few days.

Baleen Whales

- North Atlantic right whale, *Eubalaena glacialis*. Extremely rare.
- bowhead whale, *Balaena mysticetus*. Greenland, Svalbard to western Russian Arctic.
- northern minke whale, *Balaenoptera acutorostrata*. Found in the offshore and sometimes inshore waters of Europe.
- Bryde's whale, *Balaenoptera edeni*. Tropical baleen whale sometimes seen around the Canary Islands.
- sei whale, *Balaenoptera borealis*. Found throughout European waters but not in the high

Arctic. Seen inshore sometimes around Iceland and the Azores but normally found offshore.

- fin whale, *Balaenoptera physalus*. Found throughout European waters and regularly seen off Iceland, Norway, Scotland, Ireland, western Greenland, around the Azores, and in the Mediterranean.
- blue whale, *Balaenoptera musculus*. Found throughout European waters except the Mediterranean but fairly rare except for around Iceland and sometimes the Azores.
- humpback whale, *Megaptera novaeangliae*. Found off Greenland and Iceland in summer. Less often seen throughout almost all European waters.

Minke whale surfacing.

Sperm Whales

- sperm whale, *Physeter macrocephalus*. Observed throughout European waters including the Mediterranean, but usually found offshore. Can be seen off northern Norway, the Azores, Canary Islands and in the Mediterranean off Greece and Italy.
- pygmy sperm whale, *Kogia breviceps*. Fairly rare, usually off the continental shelf in European waters south of Britain to the tropics, sometimes seen in the Azores.
- dwarf sperm whale, *Kogia sima*. Fairly rare, usually on the shelf edge in European waters south of Britain to the tropics.

Eye to eye with a sperm whale.

Beaked Whales

- Cuvier's beaked whale, *Ziphius cavirostris*. Found offshore in cool temperate to subtropical European waters including the Mediterranean; it can also be seen in the Bay of Biscay and Azores.
- northern bottlenose whale, *Hyperoodon ampullatus*. Found offshore from Arctic to warm temperate European waters including the Bay of Biscay, Azores, and around Iceland.
- True's beaked whale, *Mesoplodon mirus*. Rare in temperate and subtropical offshore waters of Europe; sometimes seen in the Bay of Biscay and the Azores.
- Gervais' beaked whale, *Mesoplodon europaeus*. Rare in temperate and subtropical offshore waters of Europe.
- Sowerby's beaked whale, *Mesoplodon bidens*. Rare from cool temperate to subtropical offshore European waters; seen in the Bay of Biscay.
- Blainville's beaked whale, *Mesoplodon densirostris*. Rare from warm temperate to subtropical offshore European waters; sometimes seen in the Canary Islands.

Northern bottlenose whales return from a deep dive.

Belugas and Narwhals

- beluga, *Delphinapterus leucas*. Found in western Greenland, Svalbard and Arctic Russian waters.
- narwhal, *Monodon monoceros*. Found off central to northern Greenland, especially west coast, and offshore in Svalbard and Arctic Russian waters.

A beluga prepares to descend.

Oceanic Dolphins

- rough-toothed dolphin, *Steno bredanensis*. Deep warm temperate and subtropical waters of Europe; sometimes seen in the Azores.
- bottlenose dolphin, *Tursiops truncatus*. Observed in temperate and subtropical waters of Europe including the Mediterranean, from Scotland to the Azores and Canary Islands.
- pantropical spotted dolphin, *Stenella attenuata*. Found in the most southerly subtropical waters of Europe, in the open North Atlantic.
- Atlantic spotted dolphin, *Stenella frontalis*. Found in the warm temperate and subtropical waters of Europe, including the Azores and Canary Islands.
- striped dolphin, *Stenella coeruleoalba*. Seen in the warm temperate and subtropical waters off Europe, including the Mediterranean.
- Fraser's dolphin, *Lagenodelphis hosei*. Found in deep subtropical waters of Europe.
- short-beaked common dolphin, *Delphinus delphis*. Found in temperate to subtropical waters of Europe.
- white-beaked dolphin, *Lagenorhynchus albirostris*. Found from edge of ice to cooler temperate waters from British Isles and Norway to Iceland and Greenland.
- Atlantic white-sided dolphin, *Lagenorhynchus acutus*. Overlaps white-beaked dolphin's range but more often found in warmer waters of southern Greenland, Iceland, as well as the British Isles and Norway.
- Risso's dolphin, *Grampus griseus*. Observed throughout temperate and subtropical offshore waters of Europe. Can be seen off western Scotland, west Wales, Ireland, the Strait of Gibraltar, and in the Azores.
- melon-headed whale, *Peponocephala electra*. Oceanic tropical whale rarely found in European waters.
- pygmy killer whale, *Feresa attenuata*. Oceanic tropical whale rarely found in European waters.
- false killer whale, *Pseudorca crassidens*. Found in deep, warm temperate and subtropical European waters. Can be seen in the Azores.
- orca, *Orcinus orca*. Found from Arctic to subtropical waters of Europe with reliable sightings off Norway, Iceland, Scotland's Northern Isles and the Strait of Gibraltar.
- long-finned pilot whale, *Globicephala melas*. Found in cool temperate to subtropical waters of Europe, especially cooler, offshore waters.
- short-finned pilot whale, *Globicephala*

macrorhynchus. Found in warm temperate and subtropical waters of Europe, regularly around the Canary Islands and in the Strait of Gibraltar, among other areas.

Atlantic white-sided dolphin.

Porpoises

- harbour porpoise, *Phocoena phocoena*. Found in the coastal waters of Europe, including northern Norway, Greenland and Iceland, and the warmer coastal portions of the western Russian arctic, as well as throughout the North and Baltic seas, including the waters of the UK, Denmark and Germany.

Harbour porpoises at the surface.

What's the best season for watching cetaceans in Europe?

Throughout most of Europe, the late spring to early autumn months (May to October) are the prime periods for watching cetaceans. In northern and Arctic waters, the season may be even more restricted to between June and August. One exception is Tysfjord in northern Norway where orca watching is conducted every year from October to December when orcas follow the herring schools into the fjords. In the Mediterranean, the season can extend all year round for some species, although winter weather and sea conditions may not

be as good for watching whales. In the Canary Islands, located off north-west Africa, which are also included in this guide as they are part of Spain, whale watching is year-round, except when the hot winds from the Sahara produce a thick haze over the water. Still, the Canary Islands can usually boast 300 or more good whale watching days a year.

How to choose a whale watch tour

- Look for a tour with an experienced naturalist or guide.
- Look for high quality brochures with a strong, accurate educational content.
- Try to find a recommendation through an established research group, educational facility or conservation association. Regional associations such as the Dolphin Space Programme in the Moray Firth of Scotland, and the Scottish Marine Wildlife Operators Association on the west coast of Scotland, have professional standards that provide a basic indication of quality. WDCS has a list of some operators on its website: www.wdcs.org.
- If you have any doubt or concern at all, do not hesitate to ask about safety features, such as life jackets for each person, life boats, and a mobile phone or radio.
- Ask if there is a good cetacean guide book available on board, hydrophones for listening to the whales, and any other special features or equipment.
- Before you book a tour, ask the operator to talk about the naturalist on board and describe the tour. Ask how the tour operator contributes to research, education and conservation of the whales. Are there free or sponsored school trips?

If you find an excellent tour operator, please recommend it to others as well as to us. We welcome your further comments and suggestions. Please send us your reports on whale watching trips, positive and negative, in Europe and around the world. Send your comments to: info.de@wdcs.org (in German) or info@wdcs.org (in English).

Land-based whale and dolphin watching

Whale and dolphin watching from land is becoming ever more popular. It takes more patience, but the rewards can be considerable. Best of all, it's the ideal way to watch the natural behaviour of whales

without disturbing or influencing them. Look for areas with deep water close to shore. The best spots are at least a few metres above the sea (10-20 m or more is ideal). The platform can be a rocky outcrop or headland, a lighthouse or a building close to shore. Below are some basic tips:

- Bring along good binoculars or a spotting scope.
- Concentrate on one area of the sea for 4 to 5 minutes before moving on. Remember dolphins and many whales stay down for 4 to 5 minutes at minimum so you need enough time to ensure that you have covered a given area.
- Search the sea for something unusual - a strange splash, something dark flashing above the surface, seabirds mobbing a certain area, and so on. Spend a little extra time examining these areas to confirm whether cetaceans might be present.
- Give your eyes a break by stepping back from the telescope or putting down your binoculars and watching with the naked eye from time to time. This also helps to ensure that you're not missing something obvious that's closer or off to one side.
- Bring a friend or two, if possible, to alternate your searching time and/or to cover a wider area.
- Carry a flask with a hot or cold drink, depending on the weather, and a snack.
- If you are watching for more than an hour or two, take breaks. It is difficult to keep your attention sharp for longer than 15-30 minutes. However, there is always something of interest happening on the sea - and it's always different. So even if you don't find cetaceans, there should be lots of interesting things to discover.

Taking photo-IDs of cetaceans

Amateur photographers with good cameras can help in the study of whales and dolphins. Part of the excitement of whale watch tours is that any participant with a good camera can take a photograph that contributes to scientific work, even an important scientific finding. Many casual whale watch participants - young and old - have taken valuable photo-ID shots in recent years. Who knows, it may even be possible to discover a new species visiting an area, or a species entirely new to science! Over the past decade, two new species of whales have been described. Here are some basic tips for photography - most of these tips will help you take better photographs at sea, even if they're not useful for scientists.

- 35 mm SLR cameras are ideal, with a 300 mm telephoto or a zoom lens that extends to 300 mm.
- Use high-speed colour transparency or black and white negative film - 400-1000 ASA. More and more whale researchers, however, are switching to high quality digital cameras to provide instant access to images, as well as to remove the need for storing and processing film in the field.
- From land, use a tripod; on a boat, brace your camera against a railing or use a 'tucked arm' position, with your elbows braced against your body to help keep the camera steady.
- On a boat, a camera speed of 1/1000th of a second is best, though on calm days 1/500th or 1/250th can be OK. Even on land, minimum shutter speed to photograph moving wildlife should be 1/125th of a second, with faster speeds preferable.
- Take photographs of most whales and all dolphins at right angles to the line of travel, including the dorsal fin and the surrounding back. Ideally, take photographs from both sides of the animal but the best photos are with the sun or brightest part of the sky behind you.
- Try to anticipate and take the photo after the animal spouts and just as it lifts its dorsal fin or back to the highest position above the water. For humpback, sperm, or other fluking whales, you need to photograph them from behind, waiting till the tail is high above the water and at right angles to the camera. Be careful not to crowd or chase the whales.
- Please inform WDCS if you get sharp, close-up photos so checks can be done to see if researchers have a match. It's important to send a copy of the photograph that you don't need to have returned, not the original. Note the date and time of the photograph, the location (GPS if possible), and your name and contact details.
- The parts of the body to be photographed for photo-ID vary by species:
 - all dolphins in European waters (including orcas, pilot whales, and Risso's dolphins) - dorsal fin, saddle patch and flanks, and any unusual markings or injuries;
 - humpback whale - the underside of the tail flukes;
 - sperm whale - the tail flukes and the dorsal ridge;
 - right or bowhead whale - the head showing white patches of pigmentation or callosities; and
 - all whales, dolphins and porpoises - any unusual markings, injuries, or tags, on any part of the body should be photographed and noted.

ICELAND (Lyveldi Ísland)

Friendly minke and humpback whales, huge pods of orcas and various dolphins, and the most reliable blue whale sightings in

Europe - all combine to make Iceland a magnet for whale watchers from many countries. Since 1995, Iceland has had one of the highest growth rates for whale watching in the world. In 2002, from April to October, some 62,050 people - 30% of all visitors to the country - went whale watching. Húsavík, in the north-east part of the country, has friendly minke as well as other whales and dolphins in a protected bay. It also has the Húsavík Whale Centre - a world class whale museum and whale watch centre with stunning exhibits. On the Reykjanes peninsula near Keflavík airport and easily accessible to Reykjavík, the towns of Keflavík and Hafnarfjörður offer sighting trips for various whales and dolphins. The towns of Stykkishólmur and Ólafsvík - located on the Snæfellsnes peninsula, near the snow-capped volcano that inspired 'Journey to the Centre of the Earth' - have trips mainly May to August; blue and humpback whales are featured. In 2003, at the 3rd Whale Watching Workshop, Icelandic whale watch operators agreed to form the Whale Watching Association of Iceland (WWAI). The Húsavík Whale Centre has been promoting whale watch guidelines with all the operators in Iceland; regulations are being put in place through the Ministry of Tourism.

Yet - a dark cloud hangs over whale watching and the booming tourism industry in Iceland. Iceland's government is considering a return to whaling, with exports to go to Japan. Many Icelanders - and those who visit and love Iceland - do not want a return to whaling. Is Iceland at heart a whaling country? Or is it a pristine, environmentally conscious, northern paradise? Of course, it is not simply an either/or situation, but the perception of Iceland in the world's eyes in the coming decades may partly hinge on the whaling question.

Whale and dolphin watch tours

Reykjavik area - minke and humpback whales, white-beaked dolphins, orcas and harbour porpoises (sometimes fin and sei whales; blue whales rarely).

The fastest way to go whale watching for short-stay visitors to Iceland is 10 minutes from Keflavík international airport, in Keflavík. Here, Dolphin & Whale Spotting excursions aboard the up-to-94-passenger M/S Moby Dick bring regular naturalists and researchers working on white-beaked dolphins to the waters around the Reykjanes peninsula. Hydrophones record the sounds of the dolphins.

The Húsavík Whale Centre

In north-east Iceland, Ásbjörn Björgvinsson is a whale watch guru and guide, helping to organise many workshops and events to promote whale watch tourism all over Iceland. He has opened the first whale watch centre/museum in Iceland - one of the finest of its kind in the world. The centre has displays on all aspects of whales and features a massive outdoor mural by noted Japanese muralist Namiyo Kubo. The centre joins art and science with elegantly designed, eye-opening yet informative displays. It also has news and information on whale watching all over Iceland and helps to coordinate national whale sighting information. The centre sponsors the annual Húsavík Whale Festival, held around the summer solstice, with extended whale watch trips, special lectures and art exhibitions, a 'sand whale' contest with prizes, and other activities for the family. Ásbjörn - Abbi to his friends - is chairman of the Whale Watching Association of Iceland (WWAI). For his efforts in support of whales and whale watching, his name was recently added to the United Nations Global 500 honour roll.

NORWAY (Kongeriket Norge)

Since 1988, Norway has offered superb whale watching in a fjordic, mountainous, midnight-sun setting. Andenes is the most northerly place in the world to see sperm whales, and one of the best places to observe them through the long northern summer days. Minke, fin, pilot and other whales and dolphins are also often found. Tysfjord, a few kilometres south, offers one of the easiest and most reliable locales for watching orcas which come in close to Tysfjord in pursuit of herring from October to January. Norway has no legal regulations governing whale watching but operators are encouraged to follow guidelines in Andenes and Tysfjord.

In 1982, Norway announced it would not follow the world-wide whaling ban. It currently allows itself to kill around 700 minke whales a year, conducting hunts off the mainland, Jan Mayen Island and Svalbard. Still, it is noteworthy that, even in Norway, successful whale watching in 2 communities demonstrates a valuable economic alternative to whaling.

Whale and dolphin watch tours

The world's largest, most successful Arctic whale watching operation is Whalesafari Ltd (Hvalsafari AS) from Andøya, the northernmost part of Vesteralen, some 300 km north of the Arctic Circle. Whalesafari has 2 large ships which make 1-4 times daily trips to look for the sperm whales in the deep offshore waters. The season is from 25th May to 15th September - most of it when Andenes is bathed in midnight sun. The trips take 4-5 hours and cost NOK 685 for adults (EUR 87),

One of Whalesafari's whale watch ships.

less for children and families. Success rate is 96-99% and a free additional trip is provided if no whales are seen. Besides sperm whales, orcas and minke whales are sometimes found, as well as pilot whales, harbour porpoises, white-beaked dolphins and even fin whales. One or two multilingual naturalists help guide each trip; besides Scandinavian languages, guiding is usually available in German, English, French, Italian and Spanish. The cost of the trip includes a light meal on board and a guided tour through the Andenes Whale Centre where visitors can learn more about whales and watch videos and an informative slide show.

Hydrophones carried on every trip are used to help find the sperm whales.

Superb orca watching, close to shore, is offered through Orca Tysfjord from 10th October to mid-January, but the peak season is the 6 weeks from 10th October to late November. The orcas, which come to feed on the herring runs, stay until January but, after late November, the days are very short and the light reduced. The guided tours last 4-6 hours aboard inflatable 10-passenger boats, as well as large 90-passenger cruisers. Researchers often accompany participants on the boats. It is also possible to encounter white-tailed sea eagles on the trips.

Lookouts and marine centres

🌳 From Longyearbyen, on the western side of the Adventdalen river mouth, belugas swim close to shore.

🌲 Along the coastline near the airport outside of Longyearbyen, belugas can be seen in fairly clear waters from May (depending on ice break-up in the fjords) through the summer.

🌲 At Sveagruva, on the spit south of the airport, belugas come into the shallows to chase polar cod and capelin, sometimes getting stuck on the low tide.

🌲 The Bellsund - Van Mijenfjorden - Van Keulen-fjorden area of the west coast of Spitsbergen is the best place for belugas in summer.

RUSSIA (Rossiskaya Federatsiya)

The high northern island archipelagoes of Franz Josef Land, Novaya Zemlya and Severnaya Zemlya, and the Taymyr peninsula present a remote, forbidding picture to some. Yet, they were opened to limited tourism in the 1990s following the collapse of the Soviet Union. Trips here, mainly using ice-breakers, offer stark vistas and a wide array of arctic fauna featuring cetaceans such as belugas, narwhals, bowheads and more. Recently, Russian and Finnish whale researchers and enthusiasts have helped open up beluga watch tours, with a strong ecological component and whale watch guidelines, to the Solovetskiy Islands in the White Sea.

Whale and dolphin watch tours

Since 2000, a joint venture by a Finnish and Russian company, Kon-Tiki Tours of Helsinki and Lukomorie based in Karelia, has offered 6-7 summer trips a year to the Solovetskiy Islands to see beluga whales. These trips are open to the public and cost EUR 640 per person. Well-guided by a marine biologist with high educational, research and conservation components, the trips offer lectures on site by a Russian cetacean scientist, part of a team conducting beluga behavioural research in the area. Hydrophones and binoculars are regularly utilised during these sessions, and films and guide books are available. Participants stay at a B & B in the area.

Ferries

Harbour porpoises can be seen regularly from the Rømø-Sylt Linie GmbH ferry which runs between Havneby on the Danish island of Rømø to List, at the northern end of Sylt, a German island.

Harbour porpoises are popular off Denmark and Germany.

Lookouts and marine centres

🌳 From the south end of Rømø and between the 2 islands of Rømø and Sylt, porpoises are most often seen on the flood tides especially during the summer months.

🌳 In flat calm seas, porpoises are often seen around Kerteminde in the county of Funen. Good spots include the tip of Fynshoved, at the mouth of Odense Fjord, and on the east side of the island of Romsø, especially from the lighthouse. Boat trips can be taken from Kerteminde to Romsø.

Special attractions, events, cetacean hotlines, and other information

There is no hotline for cetacean sightings, but strandings can be reported to Zoological Museum, University of Copenhagen, Universitetsparken 15, DK 2100 København Ø, Denmark.

GREENLAND (Kalâtdlit-Nunât or Grønland) (Denmark)

Greenland offers Arctic whale watching in among the calving glaciers, ice floes and sea ice. There is also cetacean hunting. The International Whaling Commission awards subsistence whaling quotas to indigenous hunters to catch minke and fin whales. In addition, there are poorly regulated hunts of small cetaceans including orcas, harbour porpoises, belugas and others. Yet, it is still possible to encounter and enjoy watching tusked narwhals, snowy-white belugas and orcas, especially in northern areas in autumn, as well as humpback, fin and minke whales which come to feed in southwestern Greenland waters in summer. Harbour porpoises, sperm and pilot whales are also

sometimes seen. Rare but possible sightings can be made of blue and bowhead whales, especially in west Greenland. Logistics in this vast land, more than a fifth the size of all Europe, can prove difficult with air and sea travel dependent on the unpredictable weather. Best months are usually July and August; days are often lost in September and October due to poor weather or sea conditions. As well, Greenland is expensive for travel, food and accommodation. Still, Greenland offers tremendous potential for the Arctic whale watcher.

Whale and dolphin watch tours

Whale watch tours - or whale spotting as it is called in Greenland - is offered in a number of areas but can be arranged from nearly any community in Greenland. Best contacts are the local tourist offices (see below). Expect to pay DKK 500 to 900 (EUR 67 to 121) for a half- to full-day tour. It is possible to have a good whale watch experience in Greenland, but there is some risk. Some trips will not have a qualified guide or educational commentary, and there are no whale watch regulations in Greenland. Moreover, many people in Greenland still hunt marine mammals, including seals, polar bears, whales, dolphins and porpoises, and there is a chance you may encounter hunting first hand. Some local tourist offices and tour companies arrange tours to watch the hunters or, in the case of seals, to participate in the hunting. For these reasons, some people will not want to go to Greenland. Many conservationists, however, feel that the tourist to Greenland can play a valuable role simply by signing up for a whale spotting tour. In this way, the tourist's interest in whales and the willingness to pay to see whales and dolphins alive may help the long-term conservation of cetaceans around Greenland. In general, there is less hunting and more chance of having a good whale watch tour in the more southerly locations; as you go north, the level and extent of hunting increases dramatically.

A matrilineal group of orcas.

International tour operators/ companies

Arcturus Expeditions, specialists in Arctic travel aboard icebreakers, offer naturalist-guided tours of remote areas that feature wildlife, including whales and dolphins. East Greenland trips, out of Keflavik, Iceland, include voyages from Spitsbergen to north-east Greenland. Trips last 12-16 days in September. The ships include the Professor Molchanov, Professor Multanovskiy, and the Grigoriy Mikheev and all carry inflatable boats for near-shore and shore-based excursions. Prices start at £1727 (EUR 2,486).

Lookouts and marine centres

🌳 Whales can sometimes be seen from local communities, among them Aasiaat, Uummannaq, Ammassalik, and even from the capital, Nuuk. As all communities are represented by tourist services, it's best to inquire on the spot about whale presence which will depend on ice and weather conditions as well as seasonal movements of whale prey. The key tourist services' contact details are listed above under 'whale and dolphin tours.'

FAEROE ISLANDS

(Føroyar)
(Denmark)

In recent years, tourism has grown in the islands, and nature tours, particularly bird watching, are offered. Some international operators also bring visitors to the islands on marine nature tours or as part of cruises from Scotland to Iceland or Svalbard. Despite the well-known pilot whale hunt, it is possible, as part of nature tours, to see whales while travelling between the islands to view the superb bird colonies on the cliffs and the seals on the rocks. Besides the pilot whales, other cetaceans can be seen from June through August including Atlantic white-sided and white-beaked dolphins. In addition, there are regular reports of sperm and minke whales, orcas, as well as sometimes fin, blue and northern bottlenose whales. Most sightings are offshore, but orcas, dolphins and pilot whales are sometimes seen close to land, even near the capital Tórshavn. Still, at present, there is no will to expand Faeroes tourism to feature whales and dolphins. Promoting the Faeroes as a whale watch destination will also depend on the cessation of the annual hunts which each year take hundreds of pilot whales as well as various dolphins and sometimes northern bottlenose whales.

Hunted in the Faeroe Islands, pilot whales are watched in the Canary Islands by a million people a year.

GERMANY

(Bundesrepublik Deutschland)

Friendly harbour porpoises swim close to popular beaches on the German island of Sylt and the Danish island of Rømø, southwest of Denmark in the North Sea.

Ferries

Harbour porpoises can be seen regularly from the Rømø-Sylt Linie GmbH ferry which runs between Havneby on the Danish island of Rømø to List, at the northern end of Sylt, a German island.

Lookouts and marine centres

🌳 Along the beaches of Sylt, porpoises are most often seen on the flood tides especially during the summer months. Harbour seals and grey seals are also seen near the beaches.

Special attractions, events, cetacean hotlines, and other information

ASCOBANS - help for cetaceans in the North and Baltic seas

ASCOBANS covers small cetaceans only - specifically in the North and Baltic seas of northern Europe. Signed in 1991, it came into force in 1994. It has no specific provisions for whale watching, but it is concerned with the conservation of cetaceans and their habitat in this large area of northern Europe and serves as a regional agreement of the Convention on Migratory Species (CMS).
web: www.ascobans.org

IRELAND (Eire)

Commercial dolphin watching in Ireland started with the lone bottlenose dolphin, sometimes called 'Fungi', who moved into Dingle

Harbour, County Kerry, in 1984. Since then, he has brought up to an estimated 200,000 people a year to watch on boats and from land.

Risso's dolphins are often seen from Loop Head, Ireland.

The western and southern coasts of Ireland are regarded as the best land-based cetacean watching sites in the British Isles and some of the best in Europe. A resident population of more than 100 bottlenose dolphins offers the chance of reliable dolphin watching in the Shannon River estuary with accredited commercial operators. These operators must follow a code of conduct, demonstrate competence in environmental interpretation, provide monitoring data and abide by the Conservation Plan prepared for the Special Area of Conservation (SAC) recently designated in the Shannon estuary. Outside of the Shannon estuary, from locations such as Loop Head, the most commonly seen species are harbour porpoises; common, bottlenose and Risso's dolphins; and minke whales, with the largest concentrations in autumn.

Through the Irish Whale and Dolphin Group network, news of all cetacean sightings spreads fast. Full details are available on their website at www.iwdg.ie.

Whale and dolphin watch tours

Shannon estuary

Dolphin watching has become popular in the Mouth of the Shannon River estuary, out of Carrigaholt, since 1995. The first operator to offer dedicated dolphin trips here, Dolphinwatch Carrigaholt, has a 95% success rate at finding the resident dolphins. Tours last 2 to 2 ½ hours primarily from May to September. This company assists with research and encourages education; hydrophones are carried.

Lookouts and marine centres

County Cork

🌳 Cape Clear Island, according to the Irish Whale and Dolphin Group, is one of the premier whale watch locations on the South coast. There are 2 tried and tested vantage points on the island: Blannarragaun and Bullig. Twelve species have been seen: harbour porpoises (year-round); common dolphins and minke whales are regularly observed while Risso's and bottlenose dolphins along with orcas, humpback and fin whales are occasionally seen. A good source for directions and information is the Cape Clear observatory. There is a ferry to the island and a variety of accommodation including a youth hostel, B & B, camping and house rental. The Irish South coast has a winter inshore movement of fin, sei and humpback whales, which has, in the past few years, been best observed from land-based sites from as far east as Hook Head in Co. Wexford, but with more frequent sightings made from the headlands of West Cork, including Sevens Head, Galley Head and Toe Head.

Bottlenose dolphins are found around Ireland - especially in the Shannon estuary.

🌳 The cliffs looking down on the lighthouse at Mizen Head are good for common dolphins, harbour porpoises and sometimes minke whales, with sightings of bottlenose and Risso's dolphins much less common. You can park at the end of the road. Walk toward the lighthouse but turn right before reaching it to get to the cliffs. There is also a sea watching room in the lighthouse which is open daily (11 am to 5 pm) from June to September, less often from October to May, as well as a visitor centre in the light-keeper's house with interpretative cetacean materials.

🌳 Other locations: Sheep's Head and Dursey Island.

County Kerry

🌳 Bolus Head, near Ballinskelligs, is a good spot for watching harbour porpoises and bottlenose dolphins. At the end of the road, there is parking beside a farm where you can walk to the headland.

🌳 Sleat Head, at the far south-western end of the Dingle Peninsula, is a superb place to watch for harbour porpoises, bottlenose dolphins and minke whales in the tide rips of Blasket Sound. After parking at Dunmore Head, you can walk down to the point. Boat trips from nearby Dunquin Harbour sometimes see various cetaceans, including orcas, as they cross the sound to the island of Greater Blasket.

🌳 Lighthouse and Sláidín Beach, at the eastern mouth of Dingle Harbour, is the best place to try to see the wild solitary bottlenose dolphin, Fungi. Access is on foot along the shoreline from the Skellig Hotel.

🌳 Other locations: Valentia Island, Skelligs, Sybil Head, Blasket Islands and Kerry Head.

County Clare

🌳 In Kilrush, the Scattery Island Visitor Centre is setting up cetacean displays and a hydrophone listening station in 2003.

☎ +353 65 905 1329

🌳 Kilcredaun Point, near Carrigaholt, is one of the best spots to watch the resident bottlenose dolphins of the Shannon estuary. At the end of the lane beside the lighthouse, on the north side of the Shannon, there is parking and, from there, it's a short walk along a Napoleonic battery at Kilcredaun Head to a ruined church at the lookout.

🌳 At Loop Head, close to the lighthouse and the road, whale watching possibilities include bottlenose, Risso's and common dolphins, harbour porpoises and minke whales. August to October are excellent months to look for minke whales from Loop Head as they occasionally feed within a stone's throw of the cliffs.

🌳 Other locations: Kilkerin Point near Labasheeda and Napoleonic gun battery on the south side of Scattery Island - both for the Shannon dolphins. Also Black Head and Hags Head.

County Waterford

🌳 Locations: Helvick and Ardmore Head

County Galway

🌳 All along the north Connemara coast, from such spots as Cleggan Head and Renvyle Point, bottlenose dolphins are sometimes seen. The dolphins will enter both Ballynakill Harbour and Killary Harbour. The ferry to the offshore island of Inishbofin also provides a good dolphin watch opportunity.

County Mayo

🌳 Achill Head, with its high cliffs, used to be a lookout for the basking shark fishery. With expansive views over Achill Island and the open Atlantic, it is good place to wait for bottlenose dolphins in early summer. There is parking at Keem Strand below the lookout point.

🌳 The cliffs of Benwee Head, opposite Kid Island, are a prime spot for watching Risso's dol-

phins, as well as common and bottlenose dolphins. At the end of the bog road north of Kilgalligan, stop and park, then walk to the cliffs.

🌳 Other locations: Blacksod Bay and Erris Head.

County Sligo

🌳 The harbour at Mullaghmore is a good place to find harbour porpoises and bottlenose dolphins. Some years, the dolphins stay in Sligo Bay all through the summer. Minke whales are frequently observed in Donegal Bay.

🌳 Other locations: Aghris Head, Mullaghmore.

Bottlenose dolphins on the move.

County Donegal

🌳 From Malin Head, at the northern tip of Ireland, park by the castle and follow the path along the headland to see harbour porpoises, bottlenose dolphins and occasionally other dolphin species. There is some evidence that Malin Head and the Inishowen peninsula may well be seasonal orca hotspots, with several reports of orcas attacking grey seals on the rocks at Dunaldra in November.

🌳 Other locations: Malinmore, St John's Point, Dawros Head and Inishowen Head.

County Louth

🌳 From Clogher Head, on the Irish Sea, it is possible to watch harbour porpoises. Park at the fishing harbour in Clogherhead and walk up to the lookout point.

County Dublin

🌳 From the fishing port of Skerries, north of Dublin, on the Irish Sea, harbour porpoises are sometimes seen among the many grey seals that feed in and around the harbour. Best sightings are sometimes from the Rockabill and Lambay islands just offshore.

🌳 Other locations for watching harbour porpoises: Howth Head, Dunlaoighre Pier, and Killiney Bay.

County Wicklow

🌳 Bray Head: Regular harbour porpoise and grey seal sightings can be made on the walk across to Greystones within 100 m of the cliffs on the Bray side of Bray Head.

County Wexford

🌳 The Saltee Islands off Kilmore Quay are important seabird colonies but they also provide a good lookout for harbour porpoises and Risso's dolphins, with occasional sightings of bottlenose dolphins and orcas.

🌳 Hook Head Lighthouse in Hook Head, Co. Wexford, offers interpretative cetacean materials as well as land-based cetacean viewing.

Special attractions, events, cetacean hotlines, and other information

Whale Watch Ireland, a national event held at 9 classic whale watching headlands throughout Ireland every August, attracted 1,500 whale watchers in 2002.

Every summer, the Irish Whale and Dolphin Group runs whale watching weekend courses at Cape Clear, Co. Cork.

UNITED KINGDOM

Along the Cornish, Devon and Dorset coasts, in England, and in Cardigan Bay, Wales, bottlenose dolphins are resident and harbour porpoises are seen regularly. Occasionally, other dolphins, such as common and Risso's dolphins, can be seen by boat and from land along the stunning sea cliffs. Some of the most varied and productive cetacean watching in the UK is found in Scottish waters. With its lush islands, varied coastline, mountains and deep lochs, Scotland offers the wildlife tourist nearly everything, including some 24 recorded species of whales, dolphins and porpoises. Sightings range from the North Sea, to the Northern Isles of the Shetland and Orkney Islands to the extensive Western Isles, including the Inner and Outer Hebrides on the open North Atlantic.

Bottlenose dolphins live off southwest England, Wales and Scotland.

The Moray Firth and north-east Scotland offer resident bottlenose dolphins, fairly common sightings of harbour porpoises and sporadic sightings of various other cetaceans, including minke whales. The Northern Isles are home to orcas, minke whales, Atlantic white-sided and white-beaked dolphins, and harbour porpoises, among others.

Atlantic white-sided dolphins are mainly seen off northern Scotland.

Common dolphins can turn up almost anywhere around the UK and Ireland.

In the Hebridean Islands, from Mull, long-term photo-ID studies of the resident minke whales, and from Lewis, the Risso's dolphins, and Islay, bottlenose dolphins, have produced valuable findings and helped encourage the development of a marine wildlife industry which includes whale watching. You can also see common dolphins, harbour porpoises and sometimes orcas. Scotland has an abundance of good land-based whale watch sites.

Whale watch guidelines, but not regulations, have been instituted in the UK. Local codes are in place in both Cardigan Bay, West Wales, and in Pembrokeshire, and a new marine code covering cetaceans and other marine wildlife in Welsh waters, was launched in 2003. At least 3 codes are used in Scotland, the Dolphin Space Programme, specifically for dolphins in the Moray Firth, a more general wildlife code followed by the Scottish Marine Wildlife Operators Association (SMWOA), and a cetacean and seal code developed by the Hebridean Whale and Dolphin Trust (HWDT) and also used by SMWOA. WDCS has also produced a boat-users' code of conduct.

UK: Scotland

Whale and dolphin watch tours

West coast and Western Isles - most below are accredited operators who are members of the Scottish Marine Wildlife Operators Association (SMWOA) and have a code of practice, recognised by Scottish Natural Heritage (SNH), Visitscotland, Tourism & Environment, Highlands & Islands Enterprise, and Scottish Wildlife Trust (full details at www.SMWOA.org.uk).

Inter-Island Cruises carries a naturalist guide, usually a Hebridean Whale and Dolphin Trust graduate. Their trips are personable and fun as well as education- and research-oriented. Skipper Jeremy Matthews reported 420 sightings in 2002 - mostly minke whales, harbour porpoises and basking sharks, but also common, Risso's and bottlenose dolphins and occasionally orcas. 98% of cruises in 2000-2001 included cetacean encounters. Whale watching trips are £40 per person (EUR 58), or £30 (EUR 43) for under age 10. Trips for up to 12 passengers leave from Croig, near Dervaig, Mull and last about 6 hours. Guide books, leaflets and binoculars are on board, and the SMWOA code of conduct is followed. Co-operates with Hebridean Whale and Dolphin Trust and Sea Watch to report cetacean sightings and on other programmes.

Also from the Isle of Mull, Sea Life Surveys offers naturalist-led whale watching boat trips for up to 12 passengers with highly qualified researchers or naturalists guiding the trips. Sea Life Surveys has initiated and assisted with pioneer research into minke whales and harbour porpoises for more than a decade in these waters and knows where to find and how to act around the animals. The trips also encounter common, Risso's and bottlenose dolphins and occasionally orcas and basking sharks. Sea Life Surveys co-operates with Hebridean Whale and Dolphin Trust and Sea Watch to report cetacean sightings and to do other programmes. Sea Life Survey data have been instrumental in more than a dozen published scientific papers. All day whale watch trips start at £45 (EUR 65). Whale watch packages (up to 8 hours at sea per day) cost £58 (EUR 84) per day, often with a slide show for participants in the evening. Family whale watches last 4 ½ hours and cost £32 (EUR 46) for adults, £28 (EUR 40) for children. Prices go up slightly in July and August. Sea Life Surveys has won several big tourism awards.

Seals can be seen on nature and dolphin watching trips all around Scotland.

Ferries

Various whales and dolphins are regularly seen from the 8-hour ferry between the Orkneys and the Shetlands, departing from South Ronaldsay.

Lookouts and marine centres

West coast and Western Isles

🌳 The Marine Discovery Centre in Tobermory on the Isle of Mull, has cetacean exhibits, videos, interactive displays and hosts special events every year on local cetaceans. Run by the Hebridean Whale and Dolphin Trust (HWDT), it is a base for cetacean research and education on the Isle of Mull. The centre works closely with the local community and has hosted researchers and volunteers.

☎ +44 1688 302 620

✉ hwdt@sol.co.uk

🌐 www.hwdt.org

🌳 In Gairloch, the Gairloch Marine Centre is a ticket office for Sail Gairloch and has displays and information on local sightings and provides a lookout for cetaceans.

☎ +44 1445 712 636

✉ mail@Porpoise-Gairloch.co.uk

🌐 www.porpoise-gairloch.co.uk

🌳 From Greenstone Point, looking out on North Minch, north of Loch Ewe, it is possible to see harbour porpoises especially April to December and, less often, minke whales and dolphins.

🌳 From the Eye Peninsula on the Isle of Lewis, you can watch Risso's and white-beaked dolphins, along with harbour porpoises and minke whales, with some sightings year-round depending on weather and sea conditions.

🌳 Ardnamurchan Lighthouse (near Kilchoan, Ardnamurchan, Lochaber) has excellent cetacean, especially minke whale viewing. The Hebridean Whale and Dolphin Trust has conducted valuable land-based cetacean research at the lighthouse in recent years. The lighthouse visitor centre has displays on whales and dolphins.

🌳 On the Isle of Islay, overlooking Loch Indaal, it is possible to watch regularly a group of about 10 resident bottlenose dolphins. The Islay Natural History Trust has an education centre overlooking

the loch which acts as an information centre for the best marine wildlife tour operators in the area.

🌿 The Eilean Ban Visitor Centre in Kyleakin (near the Skye Road Bridge) has excellent displays on coastal and marine wildlife, including cetaceans and especially otters. It also has displays on the life of the famous naturalist Gavin Maxwell (*Ring of Bright Water*). This children-friendly centre is run by the Born Free Foundation.

🌿 Other locations: around Gairloch including Carn Dearg Youth Hostel on the coast road to Rubha Réidh, just west of Lonemore, where the road turns inland; the southern entry point to Loch Gairloch, Sron na Carra, just off the coast road south of Gairloch; the high ground at Red Point looking out over North Minch, as well as south to Loch Torridon; and on the other side of Loch Torridon, where the south entry point at Rubh na Fearn allows a wide view of the Loch and the open North Minch.

Northern Isles

🌿 Sumburgh Head, at the southernmost tip of the Shetlands, is a good lookout for harbour porpoises, various dolphins, as well as minke, orcas and sometimes humpback whales, among the 22 cetacean species recorded in Shetland waters.

🌿 Other locations for watching harbour porpoises include Mousa, Boatsroom Voe, Quendale Bay (particularly between November and April) East Yell Sound, Out Skerries, Whalsay and between Noss and Sumburgh Head (all 4 sites also good for Risso's dolphins), as well as, on the west coast, Scalloway and West Burra Isle. Risso's dolphins have also frequently been sighted, mainly between April and September, at Balta Sound. Also sometimes sighted from shore are white-beaked dolphins, pilot whales, orcas and minke whales.

Humpback whales are sometimes seen in Shetland and other Scottish waters.

North-east coast, Moray Firth and Grampian

🌿 The Moray Firth Wildlife Centre (MFWC), located at Spey Bay, is the best place to start learning about the Moray Firth dolphins. It features shore-based dolphin watching from the centre itself, along with seals, otters, ospreys, and many other bird species. Teaming up with WDCS, the Whale and Dolphin Conservation Society, the MFWC has developed an excellent series of programmes to aid awareness and understanding of cetaceans, other local wildlife and the environment. Besides the exhibition (admission free), there are outreach programmes such as school visits and mobile exhibits at wildlife fairs.

☎ +44 1343 820 339

✉ enquiries@mfwc.co.uk

🌐 www.mfwc.co.uk

🌿 At the Dolphin and Seal Centre, North Kessock (near Inverness at the mouth of Beaully Firth), it is often possible to see the dolphins from shore, and there is an exhibition area. Sightings can be year-round but it's best from late May to September with the 2-3 hours before high tide offering almost guaranteed dolphin watching.

🌿 Opposite North Kessock, on the north edge of Inverness, where the bridge crosses the Kessock Channel, there is a good viewpoint.

🌿 Chanonry Point, near the mouth of the Firth of Inverness, is one of the best land-based sites. The dolphins often pass enroute to and from the open Moray Firth.

🌿 At Fort George, opposite Chanonry Point and accessible by road, is another spot.

🌿 At the mouth of the Cromarty Firth (the Sutors), one of the best year-round lookouts for bottlenose dolphins is along the coast outside of the town of Cromarty. An old lighthouse cottage here is the base for research into the bottlenose dolphin and seal populations of the area.

🌿 At the harbour, in Cromarty, the whale watch operator Dolphin Ecosse has a small exhibition centre for cetaceans.

☎ +44 1381 600 323

✉ info@dolphinecosse.co.uk

🌐 www.dolphinecosse.co.uk

🌳 On the north (opposite) side of the mouth of Cromarty Firth, a good lookout can be found at the end of the road, south of Nigg.

🌳 From Tarbat Ness, near the lighthouse beyond Portmahomack, walk to the point where there is a superb view of the open Moray Firth, North Sea and parts of the Dornoch Firth, and, sometimes, sightings of dolphins and even harbour porpoises.

🌳 At Burghead, accessible by road, the point sticks out into the Moray Firth, and is close to deep water, making it a good year-round viewpoint for the bottlenose dolphins as well as minke whales in late summer and autumn.

🌳 Cullen is a good place for seeing bottlenose dolphins and harbour porpoises, as well as minke whales, later in the season (August to October).

🌳 Other locations: Lossiemouth, on the coast north of Elgin; Buckie; Portknockie; headlands north of Banff; Kinnairds Head, near Fraserburgh; and Rattray Head.

South-east coast

🌳 The Scottish Seabird Centre (SSC), at the harbour, in North Berwick, has solar-powered remote control cameras on nearby islands for watching seabirds, seals and other wildlife, and various exhibits, some of which feature cetaceans. There are also excellent spotting scopes on an outdoor deck overlooking the Bass Rock (world's largest gannet colony) and other islands at the mouth of the Firth of Forth. The gannets and puffins are reliable through the spring and summer, while dolphins and minke whales are occasionally seen from the deck.

Lookouts and marine centres

 Durlston Country Park and Marine Project, at Durlston Head, south of Swanage, has a Visitor Centre where you can listen to bottlenose and other dolphins and porpoises live, as they pass by in the English Channel. The listening system has speakers hooked up to a mounted hydrophone offshore in Durlston Bay. The Durlston Marine Project conducts acoustic research using a towed hydrophone system to survey the area, as well as a device called the POD (POrpoise Detector) developed by Nick Tregenza which records sounds whenever echolocation clicks are heard (about once a month the unit is retrieved, the batteries changed and the information downloaded to PC). The POD can identify dolphin and porpoise presence at night and during stormy conditions. The dolphins can sometimes be seen, too; the best viewing spots are below the centre, accessible on foot. There is also good bird watching, and the area has been made a volunteer marine nature reserve.

Out of the blue - a new kind of whale watching company - all for conservation

Out of the blue is a non-profit travel company operated by WDCS, the Whale and Dolphin Conservation Society. WDCS's expertise in whale and dolphin watching is acknowledged world-wide. WDCS has been closely involved in the whale watch industry through the monitoring of its growth and development, running training programmes for operators and naturalists, and advising on setting up guidelines and regulations. Through its network of researchers, it has a handle on the best places and times to visit, the best boats and local experts to use, and how to watch cetaceans responsibly. Groups are kept as small as possible to ensure that the experienced guides on every trip can give everyone attention, making the trips informative as well as fun. Best of all for the whales, the proceeds from all out of the blue trips go toward conservation work in the field. Out of the blue is the only non-profit travel company in the UK specialising in whale and dolphin watching.

Out of the blue trips include 3-night dolphin short-breaks to the Moray Firth of Scotland and Cardigan Bay in Wales, combined whale and dolphin trips to Mull and the Moray Firth, as well as 8- to 9-night trips to watch cetaceans around Iceland and the Azores. Out of the blue has many other trips to destinations such as Canada, South Africa, Patagonia and the Maldives and is developing new trips all the time, so check the website or send for a brochure.

Pilot whales 'logging' at the surface.

Bay of Biscay bonanza

In summer 1995, a small group of researchers boarded the P&O and Brittany Ferries that regularly travel between England and Spain to do cetacean surveys from the deck. Some 14 cetacean species were seen on those early cruises and the idea of using a regular ferry to do scientific research, as well as to have fun whale watching, was born. Since then, because of their efforts, the Bay of Biscay has become one of the great cetacean spectacles in the world. All the more amazing is that the Bay of Biscay was where whaling first became commercial - the site of intensive early Basque whaling dating from around 1000 AD.

Some 20 cetacean species have been seen, including up to 10 on one day. July and August are the best months, but most species are also present in May, June and September. Rounding the Brittany coast, the researchers often meet bottlenose dolphins, harbour porpoises, minke whales and basking sharks, with common and striped dolphins and long-finned pilot whales appearing as the ship moves into deeper waters. The prime area for sightings of the mainly larger species begins roughly half way between the Brittany coast of France and northern Spain when the boat moves into very deep water above the abyssal plain and canyons, off the continental shelf. The species here include fin, sei, blue, sperm, short-finned pilot, and false killer whales; orcas; Risso's, Atlantic white-sided, and white-beaked dolphins; as well as beaked whale species including the northern bottlenose whale and Cuvier's, Sowerby's, and True's beaked whale. There are also ocean sunfish, basking shark, tuna and occasional swordfish sightings.

The Company of Whales offers 2 basic trips, both of which depart Portsmouth, England, and include two 18- to 35-hour ferry crossings with excellent cetacean, seabird and marine nature watching and highly qualified naturalists and researchers. The main trips are the 3-day summer trips at a cost of £199 (EUR 287), which run on average once or twice a week from 21st June to 23rd September.

Participants stay on the ship and have full access to all the ship's facilities. There is a morning-long land-based excursion around Bilbao, Spain. The first 2 and the last summer trips offer participants the chance to learn cetacean survey techniques in addition to the usual sighting opportunities. Another offering 'Springtime in the Picos,' is a week-long trip given only from late April to early June, which costs £699 (EUR 1,007). This trip includes a few days' nature excursions in Spain. All cetacean records on the surveys are submitted to Organisation Cetacea (ORCA) (www.orcaweb.org) for an annual report on the distribution, ecology and conservation status of the Bay of Biscay cetaceans. In addition to supporting this research, the Company of Whales uses some of its profits to support the conservation and research projects of WDCCS, the Whale and Dolphin Conservation Society (www.wdcs.org); the Marine Connection (www.marineconnection.org); and the Cetacean Section of La Société Guernesaise (www.cidolphins.org.uk). For more Bay of Biscay trips, see under Spain.

PORTUGAL

(República Portuguesa)

The Sado Estuary, south of Lisbon, has resident inshore bottlenose dolphins. One of Europe's longest-studied dolphin populations (since the early 1980s), the dolphins that habitually use the estuary number only 31 to 39 individuals. Occasionally, common dolphins and harbour porpoises are also seen. There are no whale watching regulations yet in Portugal but the dolphin watch boats aim to follow a code of conduct.

Whale and dolphin watch tours

Vertigem Azul offers year-round 3-hour boat trips along the Sado Estuary and the Arrábida coast to see the resident bottlenose dolphins. The trips use a semi-rigid inflatable boat with a capacity of 20 passengers. The captain and an assistant guide provide the commentary. The dolphins are seen on 95% of all trips. This company also offers programmes for schools and sometimes carries researchers on the trips.

Lookouts and marine centres

Ilhas Desertas, Ponta de S. Lourenço, and Ilhéu da Viúva are natural reserves and proposed marine protected areas that have regular bottlenose dolphin sightings in inshore waters.

AZORES (Açores)

(Portugal)

In the Azores, whale watching started to flourish by boat and from land in 1989 - 2 years after the end of traditional whaling in the islands. The 'vigias' or small watch towers, originally used by whalers to find whales, are being restored and some, such as the Vigia da Queimada, allow sightings on a clear day for up to 30 km. On offer is an astonishingly wide variety of cetaceans due to the islands' central Atlantic position on the mid-Atlantic Ridge and the sheer drop-off close to shore. Hunting in the canyons around the volcanic Azores are sperm, blue, fin and sei whales; northern bottlenose and other beaked whales including Cuvier's; bottlenose, spotted, common, Risso's and striped dolphins; false killer and pilot whales; and orcas. The season lasts from mid-April to mid-October. Whale watch permits are issued by the Dept. of Tourism and regulations have been developed but are not fully enacted. Hence, compliance is patchy, and the quality of whale watching - particularly the educational component - can vary.

Whale and dolphin watch tours

For the past decade, from April to October, Whale Watch Azores has sailed the waters around the Azores, consistently leading excellent trips combining research, education and fascinating insights into cetaceans and their world. Their 7- to 11-day excursions employ a new power catamaran which carries 12 guests and departs from Horta, Faial, Azores. There is also a land-based component. The company is building a research and education centre on São Jorge Island which will offer accommodation to trip participants beginning in 2005. Researchers Lisa Steiner and Chris Beer are on board as naturalists as well as scientists who do photo-ID of sperm whales, and bottlenose and Risso's dolphins. They also collect skin samples from the sperm whales for DNA studies, and tow a 100 m hydrophone for locating and recording cetaceans.

Lookouts and marine centres

🌳 Europa Point, at the southern tip of Gibraltar, is a 15 m cliff overlooking a tide rip near the Mediterranean entrance to the Strait of Gibraltar. Most days, a pod of common dolphins will come in at some point to feed in the tide rip. About once a month, bottlenose dolphins appear. Some years, the spouts of young fin whales can be seen. However, in moderate to rough seas or if visibility is impaired by fog, the dolphins are impossible to see.

Special attractions, events, cetacean hotlines, and other information

Cetacean sightings and strandings should be reported to the Spanish Cetacean Society.

☎ +34 918 565 429
 ✉ sec@cetaceos.com
 🌐 www.cetaceos.com

Some operators in Gibraltar take participants to swim with dolphins although it is against local guidelines. WDCS, among other groups, does not encourage people to swim with any species of cetacean.

Common dolphins are frequently encountered inshore in the Strait of Gibraltar.

SPAIN (Reino de España)

Spain has at least 5 distinct regions for whale watching:

In the Bay of Biscay, from Gijón to San Sebastián, regular inshore sightings are made of common, striped and bottlenose dolphins, with offshore sightings of Risso's dolphins, orcas, and minke, fin, sperm, long-finned pilot and various beaked whales. (See Bay of Biscay bonanza, p. 42).

In Galicia (north-west Spain), bottlenose dolphins have been followed for more than a decade by researchers. Farther offshore, they also sometimes see striped, common, and Risso's dolphins, as well as minke, fin and long-finned pilot whales. Occasionally, they also see false killer whales, orcas, harbour porpoises, and Cuvier's beaked whales. However, these cetacean and other marine animals are being affected by the large coastal oil spill of 2002.

Out of Cádiz and Tarifa, on the Strait of Gibraltar, in south-west Spain, bottlenose, common and striped dolphins and pilot whales can be seen year-round. Sperm whales (April-July) and orcas (mainly July and August) can also be found, as well as sometimes fin whales (especially early summer).

The near-shore waters of the Alboran and western Mediterranean seas, from the Costa del Sol to the Costa Blanca, have some of the best areas in the Mediterranean for dolphins, particularly just east of the Strait of Gibraltar. Inshore, common, striped, and bottlenose dolphins can be seen, with Risso's dolphins, long-finned pilot, fin and sperm whales offshore.

From the Golfo de Valencia to the Costa Brava, including the Balearic Islands (Balears), are additional possibilities for cetacean tourism. There are common, striped and bottlenose dolphins inshore, with long-finned pilot, fin and sperm whales offshore.

Regulations have been formulated for Spain, particularly to address the problems in the Strait of Gibraltar with the rapidly-growing whale watch industry and the background presence of considerable shipping, marine tourism, and fishing boat traffic.

Whale and dolphin watch tours

The research group CIRCE invites volunteers to help with orca and other cetacean research in the Strait of Gibraltar with 12-day stints from mid-July to mid-September. CIRCE (Conservación, Información y Estudio de Cetáceos - Conservation, Information and Research into Cetaceans). Cost is EUR 1,000 (not including accommodation and meals, except lunch). Besides orcas, CIRCE works with sperm, fin, and pilot whales, as well as bottle-nose dolphins.

Orcas are frequently seen in the Strait of Gibraltar.

In Tarifa, west of Gibraltar, a Swiss group, FIRMM (Foundation for Information and Research on Marine Mammals), offers day trips as well as week-long courses in marine mammals, in German, from April to October. They also do public education programmes in the schools and with local people, and have regular whale watch 'tourist' day trips, suitable for families, with briefings in 5 languages about Gibraltar Strait and the marine wildlife, focusing on whales and dolphins. On all cruises, they record sightings of animals, with number, behaviour, tide, weather and GPS position. The week-long courses include land-based lectures about biology and threats to cetaceans, as well as trips to see them; cost is EUR 310 per person. The 2- 2 ½-hour boat trip uses a 12 m boat and costs EUR 27, with reduced rates for children.

CANARY ISLANDS

(Islas Canarias)

(Spain)

Some 500+ short-finned pilot whales as well as bottlenose dolphins resident to the waters off south Tenerife have made this one of the world centres for whale watching. However, few of the hundreds of thousands who go whale watching from Tenerife each year realise that an abundance of other whale and dolphin species are found throughout these waters, just offshore - sperm whales, rare beaked whales, various tropical dolphins. This is also one of the few places in the world where whale watching is truly year-round. With some notable exceptions, the overall standard of whale watching, however, has been low with a lack of understanding about the potential impact on the animals as well as too few educational, scientific and conservation benefits for the community and for the visiting whale watchers. Regulations and some enforcement are now in place and things are improving, but more boats need to carry naturalist guides if Canary Islands whale watching is to meet the standards set in other parts of Europe. You can do your part by asking any operator, before you book the tour, if they carry a qualified naturalist guide.

Whale and dolphin watch tours

La Gomera

Half-day trips are offered aboard open Canarian fishing boats and a steel ketch for 5 to 11 passengers. Club de Mar carries biologists, while the cap-

tain acts as the guide. The pilot whales, Atlantic spotted and bottlenose dolphins are regularly seen, with the chance of common, striped and rough-toothed dolphins, beaked whales and, sometimes, large baleen whales.

Resident pilot whales are the main species attracting whale watchers in the Canary Islands.

The UK-based Atlantic Whale Foundation has worked closely with several operators in Tenerife to establish the Confederation of Whale Watching Boats of Tenerife. Through the confederation, the foundation promotes ethical whale watching and various other educational, research and conservation initiatives. It also sponsors the European Festival of the Whale which is held every July and August in Tenerife and includes parades, a world music concert, children's workshops, exhibitions, a cetacean conference and other activities. For information on whale watching in Tenerife, on participating in the European Festival of the Whale, on volunteering (year-round, minimum 2 weeks) and on assisting in various research projects, see the contact details below.

Some operators in the Canary Islands take participants to swim with pilot whales and dolphins. WDSCS, among other groups, does not encourage people to swim with any species of cetacean.

FRANCE (République Française)

Bottlenose dolphins and harbour porpoises are found along the Brittany and Normandy coasts.

Off the Atlantic coast of France, the Bay of Biscay has a wide variety of cetaceans (see Spain). In the Mediterranean Sea in general - and specifically in the Pelagos Mediterranean Sanctuary for Cetaceans in the waters of France, Monaco and Italy - bottlenose and striped dolphins can be seen reliably, sometimes close to shore, while farther out, fin, sperm, and long-finned pilot whales as well as Risso's and short-beaked common dolphins can be seen fairly reliably. It is also possible to see Cuvier's beaked whales. Bottlenose dolphin sightings are also possible around Corsica.

Whale and dolphin watch tours

The 'Whale and Dolphin Monitoring Project' is a Swiss research project to study the cetaceans off the Côte d'Azur and in the Pelagos Mediterranean Sanctuary for Cetaceans. The week-long cruises, which depart from St Raphaël on a 14 m sailing vessel, are open to 6 ecovolunteers per week from June to early August. Fee is CHF 1'500 (EUR 996) including all food and accommodation but exclusive of travel to the port. Main language on board is German. These cruises offer the interested public a chance to encounter cetaceans in their natural environment as well as to do something practical for cetacean conservation.

📄 www.tethys.org/index_e.htm

ITALY (Repubblica Italiana)

With its unique central position protruding into the Mediterranean Sea, and the longest coastline of any southern European country,

Italy is well situated for watching a variety of cetaceans:

From the north-west, the Ligurian Sea has fin, sperm, long-finned pilot and Cuvier's beaked whales, as well as striped, short-beaked common and Risso's dolphins. In the Tyrrhenian Sea are bottlenose dolphins especially in summer, along with striped dolphins, long-finned pilot and fin whales, among others. In the Adriatic Sea, off eastern Italy, are mainly bottlenose dolphins in the northern part and striped and Risso's dolphins in the south. Around Sardinia are resident bottlenose dolphins, along with, offshore, short-beaked common, Risso's and striped dolphins, and fin and sperm whales.

Italian researchers, along with researchers from other Mediterranean countries, have helped formulate whale watch regulations as part of the ACCO-BAMS agreement but the regulations have yet to come into force in Italy.

Short-beaked common dolphins are studied and watched off Italy and Greece and are one of the resident species of the new Pelagos Mediterranean Sanctuary for Cetaceans.

Whale and dolphin watch tours

Working in the Mediterranean since 1987, the Tethys Research Institute has developed a special blend of field study cruise and high-quality marine nature tourism. Participants pay to accompany the scientists and help out on exciting research cruises. These cetacean field-study tours resemble Earthwatch programmes but are less formal and there is more flexibility for individual participants. Tethys field study tours take visitors to the Ligurian Sea as well as to other areas in the Mediterranean. In past years they have also sponsored excursions to study dolphins in Croatia and Greece, and pilot whales in the Canary Islands and various other cetaceans in the Caribbean.

The 'Cetacean Sanctuary Research' course focuses on the various cetaceans of the Ligurian Sea in 2 different habitats. The first is the pelagic area where fin whales are found in summer between the French-Italian coast and Corsica. Here, participants join the Mediterranean Fin Whale Programme which has focused on the ecology and the behaviour of fin whales since 1990. The other habitat is the coastal continental slope area where toothed whales feed on squid and other species. The Squid Loving Odontocete Project (SLOPE) includes assorted mainly squid eaters: the sperm, Cuvier's beaked and long-finned pilot whales, as well as Risso's, short-beaked common and bottlenose dolphins. Project participants are given lectures on cetaceans and marine biology. Together with the researchers, they participate in all field activities, including photo-ID work, sound recording, suction-cup tagging, and sighting shifts day and night; they may also be involved in friendly 'cooking competitions'. If weather conditions are poor, the participants take inland trips and visit local towns and museums including San Remo, and the Monte-Carlo Oceanographic Museum.

ACCOBAMS - help for cetaceans in the Mediterranean Sea and Black Sea

ACCOBAMS is an agreement which covers all aspects of marine conservation between countries bordering the Mediterranean Sea, Black Sea and the contiguous Atlantic. Signed in 1996, ACCOBAMS came into force in 2001. Whale watching is one of the concerns of the ACCOBAMS agreement and, during the 'first meeting of the parties' preliminary guidelines were produced as part of 'Cetaceans of the Mediterranean and Black Seas: State of Knowledge and Conservation Strategies.' These guidelines will be refined at future meetings of the parties. The agreement calls for the range states and the European Community to put in place conservation measures regarding marine habitats in the ACCOBAMS region. ACCOBAMS is highly regarded and could be a good model for marine and other agreements in other parts of the world.

The Pelagos Mediterranean Sanctuary for Cetaceans

The Pelagos Mediterranean Sanctuary for Cetaceans, established in late 1999 by Italy, France and Monaco, is a landmark achievement. Informally referred to as the Ligurian Sea sanctuary, it is located both in the national waters and on the high-seas off Italy, France and Monaco (see map, p. 30). The sanctuary has also been entered into the list of Special Protected Areas of Mediterranean Interest (SPAMI) under the Barcelona Convention. Protecting cetacean habitat in the Mediterranean is important as is the worldwide significance of the international high-seas designation and the implications for other potential areas in terms of co-operation between countries.

The motivation for creating the Pelagos Mediterranean Sanctuary for Cetaceans - originally called the Pelagos Project - came from the regular research cruises of the Tethys Research Institute. At the same time, through the 1990s, pelagic drift-net

fishing was shown to be a big problem because of the large number of species that were being accidentally caught and killed. Tethys' cruises revealed the presence of substantial cetacean concentrations within the area, resident populations of striped and other dolphins, Cuvier's beaked and sperm whales, as well as seasonal concentrations of fin whales. The cruises also found a conspicuous variety of other pelagic species such as tunas, swordfish, sunfish, sharks and occasionally sea turtles and devil rays - a high degree of marine diversity in a productive ecosystem with a large krill and other zooplankton biomass.

The pelagic driftnet fishing in the area was banned by the European Union as of January 2002. However, French fishermen are now using a new kind of oceanic drift-net to catch tuna - controversial because they claim it is not a drift-net and some try to anchor it to the seafloor with rocks to prove the point - but it is a drift-net and it has a bycatch of cetacean and other marine life. A key part of the new economic mandate for the sanctuary will be whale watching and marine ecotourism. This is also crucial for the public education and research components of the sanctuary.

In 2001, an inventory of biological, cultural and other features was prepared for the area, which is now on file with the secretariat of ACCOBAMS - the agreement between Mediterranean Sea and Black Sea countries on marine conservation. For more information about the sanctuary, contact Tethys Research Institute.

The fluke of a sperm whale.

CROATIA (Republika Hrvatska)

A strong candidate marine protected area in the waters surrounding the wooded offshore islands of Cres and Losinj is home to a resident population of bottlenose dolphins. Researchers from Tethys worked here for most of the past decade. Since 2001, the project's management has been passed to the Croatian organisation Blue World. Blue World now offers dolphin tours during the peak season of June through September, following a code of conduct.

Croatian waters - site of the Adriatic Dolphin Project.

Whale and dolphin watch tours

12-day dedicated bottlenose dolphin research tours are offered by Blue World to Veli Losinj, Croatia. The trips are led by researchers from the Adriatic Dolphin Project who act as naturalists and present special lectures. Participants travel in a 6 m rubber inflatable or 5.2 m plastic boat, each carrying up to 8 passengers. GPS, hydrophones, and binoculars are available. Research on the project includes work on population dynamics through the monitoring of population size, genetic analyses and acoustic work. The dolphin researchers regularly present lectures in schools, universities, hotels and to community groups.

OTHER EUROPEAN COUNTRIES

Various coastal European countries are not listed in this guide including several in the Baltic Sea (Finland, Sweden, Estonia, Latvia, Lithuania, and Poland), the North Sea (Belgium and the Netherlands), the Black Sea (Bulgaria, Romania, Ukraine, and Georgia) and the Mediterranean Sea (Malta, Albania, Slovenia, Bosnia-Herzegovina, Yugoslavia and Cyprus). Most of these countries have historic or somewhat offshore and inaccessible populations of whales, dolphins and porpoises, but none of these countries currently offers commercial or educational whale watch opportunities. Finland, for example, has records of porpoises and even larger whales and dolphins, but has no currently known population in its waters. The Black Sea countries of Bulgaria, Romania, Ukraine, Georgia, as well as Turkey and Russia, however, do have, despite formerly intense exploitation, populations of bottlenose and common dolphins, as well as harbour porpoises, yet at present there is no commercial whale watching. It is our hope that this guide will stimulate the growth of new high quality whale watch opportunities in some of these countries. To prospective whale watch operators, as well as readers of this publication, we ask you to please tell us about these efforts as they develop in new countries so that we can help with technical expertise and suggestions as needed.

Reporting and accessing whale and dolphin sightings in Europe

A number of scientific and conservation groups in various countries have schemes for reporting whale and dolphin sightings. In addition, the WDCS website is set up to handle sightings for all European countries. Sightings can be reported by any member of the public, students, people who go on whale watch holidays or who make casual sightings, as well as WDCS supporters. Sightings can be reported to the website www.dolphinsightings.org by filling out the easy on-line survey form, or printing out the form and returning it to WDCS. Sightings can also be reported by telephone or regular mail. A brief summary of your sighting information will appear with your name on the WDCS website. It is possible to browse all the sightings collected to date from all parts of Europe.

WDCS, the Whale and Dolphin Conservation Society
Brookfield House, 38 St Paul Street, Chippenham
Wiltshire SN15 1LJ England
tel: +44 (0)1249 449 500
fax: +44 (0)1249 449 501
email: sightings@wdcs.org
web: www.dolphinsightings.org

If you are reporting sightings without using the form, please remember to include:

- your name, address, plus the date and exact location of the sighting,
- duration of sighting and distance of the animal from you (metres),
- species seen (please note if definite, probable or possible),
- number of animals in the group, including any calves,
- behaviour if known (feeding, resting, active, travelling),
- any distinguishing features (eg. obvious deformities), and
- other vessels or wildlife in the area.

Note to all operators of whale watching and marine nature tours in Europe

Things change. If you are listed in this guide and your contact or other details have changed, please let us know. Contact ehoyt@compuserve.com, and please cc: nentrup@wdcs.org and vanessa.williams@wdcs.org. Similarly, if you operate high-quality whale watching trips in Europe and have not been featured, please send us your brochure and other supporting information about your trips for future editions of this guide and for other publications. If your company or group is already featured on the whale watch pages of the WDCS website (www.wdcs.org), you may also want to update your listing. If you are not currently featured on the website but would like to be considered, please email info@wdcs.org to receive a questionnaire.

Over the years, WDCS has received numerous reports, positive and negative, from its supporters about whale watching operators and tours. Common complaints include lack of a good naturalist-guide, too many boats, and boat operators driving too aggressively toward cetaceans or approaching too close. Of course, many others write to us to tell us about the trip of a lifetime.

WDCS's primary aim, through this guide, is to celebrate and support high-quality whale watching with a trained naturalist present on every trip - whale watching which contributes to education and research as well as to the conservation of cetaceans around Europe. WDCS believes that high-quality whale watching is best not only for the whale watch customer, but also for operators, as well as the whales and dolphins themselves. Let's make every whale watch trip a potential trip of a lifetime!

What is high-quality whale watching (HQWW)?

Whale watching: tours by boat, air or from land, formal or informal to see and/or listen to any of the some 86 species of whales, dolphins and porpoises

High quality whale watching (HQWW)

- is a prime recreational and educational experience for participants which motivates them to care about whales and the sea and to work for or contribute to its conservation;
- provides scientific benefits to researchers and public knowledge about cetaceans;
- is built around a naturalist or nature guide who can tell good, accurate stories and build the bridge between the urban participant and the sea;
- can be practiced by independent businesses, researchers, communities, conservation groups or co-operatives;
- involves the community/region in its work, leading communities/regions to have a financial interest in whale watching and the conservation of whales and the sea.

Some of the world's most successful whale watching is HQWW. However, less than half of all existing whale watch tourism worldwide qualifies as HQWW. WDCS, the Whale and Dolphin Conservation Society, believes that whale watching would be much more successful for operators, as well as beneficial for participants and the whales themselves, if all of it could be HQWW.
